

Research Letter

Highlights

- Nationally, during the 1990s the retention rate of African Americans, Latinos, and American Indians in engineering is 36.5 percent based on an analysis of the entering freshmen classes from 1991 to 1993 and graduating classes from 1996 to 1998. This is a slight improvement in the minority graduation rate from NACME's previous estimate of 35.0 percent in 1995. However, the gap between the rates at which minorities and non-minorities graduate has grown. The graduation rate of nonminority freshmen is 68.3 percent, up from 59.3 percent in 1995.
- At current graduation rates, a minority student entering a college engineering program is only half as likely (53.4 percent) to obtain a bachelor of science degree in engineering as a nonminority student. This is a widening of the disparity in retention rates since 1995 when relative retention stood at 59.1 percent.
- The retention rate for African American freshmen is 32.3 percent; for American Indians 34.0 percent; and for Latinos 44.5 percent. African Americans and American Indians graduate at less than half the rate of nonminority freshmen, approximately 47.3 percent and 49.8 percent respectively. Latinos graduate at nearly two-thirds (65.0 percent) the rate of nonminorities.
- Of the eight Historically Black Colleges and Universities (HBCUs) that met the criteria for inclusion in the study, four have a minority retention rate that is higher than the national minority retention rate of 36.5 percent. The average retention rate for African Americans at the HBCUs is higher than the national African American retention rate: 36.1 percent compared to 32.3 percent.
- Of the five Hispanic Association of Colleges and Universities (HACUs) members that met the criteria for inclusion in the

Keeping What We've Got: Effective Strategies for Retaining Minority Freshmen in Engineering

by Annie Georges, Ph.D.

Introduction

During the last 25 years engineering institutions have made enormous progress in providing access to underrepresented minorities. In 1997-98 the number of minority graduates reached a new high — 6,374 African Americans, Latinos, and American Indians earned bachelor of science degrees in engineering. Despite the overall progress, however, the number of African American and American Indian graduates actually declined for the first time in almost a decade; only Latinos made significant gains. Looking toward the future, an erosion in the overall number of minority engineering graduates is presaged by the fact that the enrollment of minority freshmen has declined eight percent since its peak in 1992-93; the enrollment of African Americans declined a devastating 17 percent during these six years.

The recent drops in the number of minority freshmen entering the nation's engineering schools raises the urgency of retaining minority students already enrolled. This study continues NACME's series on the performance of engineering institutions in retaining minority freshmen through graduation. As in our earlier studies, the objective is to develop a better understanding of the institutional factors that determine success in encouraging retention through the bachelor's degree. Our findings reveal that financial aid awards may be key variables that can be considered at the policy level to improve the minority retention rate in engineering across all institutions. Clearly, with declining minority

enrollment, it is imperative that we do a better job of keeping what we've got.

Background

In this study we use four indices to evaluate the performance of engineering institutions in graduating minority freshmen: 1) the total number and proportion of minority graduates; 2) the proportion of full-time minority freshmen who earned a bachelor's degree in engineering, which we refer to interchangeably as the retention rate or the graduation rate; 3) the retention rate of minorities relative to the retention rate of nonminorities, which we term the relative retention index; 4) and the total number and proportion of entering full-time minority freshmen. The inclusion of minority freshman enrollment data among our indices is important for two reasons: first because it allows us to assess the pool of available talent for future production of graduates and second, it gives us a window into institutional commitment in the face of a continuing decline in minority freshmen enrollment in engineering programs across the nation, particularly among African Americans. Moreover, an analysis of entering freshmen enrollment readily identifies institutions where greater effort is needed if the number of minority engineers is to increase over time.

Minority Enrollment and Graduation

This analysis is based on the entering freshman classes from 1991-92, 1992-93,

Annie Georges is research associate of NACME, Inc.

and 1993-94, and the graduating classes of 1995-96, 1996-97, and 1997-98. During the years covered by the study the number of minority students enrolling in engineering programs increased slightly from 14,153 in 1991-92 to 14,384 in 1993-94, an overall

Highlights (continued)

study, two have a minority retention rate that is higher than the national average. The University of Texas-San Antonio achieved a minority retention rate of 75.0, surpassing even the national nonminority retention rate of 68.3 percent. The average retention rate for Latinos at the HACUs, however, is lower than the national Latino retention rate, 36.0 percent compared to 44.5 percent.

- The average number of minority graduates for all 348 engineering institutions was 18 during the period covered by this study. Only 35 institutions graduated an average of 50 or more minority engineers per year during that time. Ten of these institutions graduated an average of 100 or more minority engineers per year. North Carolina A&T State University graduated the greatest number of minority engineers — an average of 244 per year during the study period.
- The minority retention rate at highly selective institutions is well above the national average; 49.5 percent of enrolling minority freshmen graduate. At non-selective institutions the minority retention rate is only 17.6 percent. Although, in general, the retention rate of minorities and nonminorities is correlated with selectivity, the performance of individual institutions within each level of selectivity varies widely.
- The availability of financial aid is an important factor in accounting for the differences in the performance of individual institutions. The retention of minorities in engineering seems to be more responsive to changes in financial aid awards than to any other factor we considered in this analysis. Hence, financial aid may be a key policy variable for improving minority retention.

percentage change of 1.6 percent. The number of minority graduates grew 1.0 percent from 6,331 in 1995-96 to 6,374 in 1997-98.

Figure 1 shows that the distribution of minority graduates among engineering institutions remained much as it was during the 1980s and early 1990s, highly skewed with a small number of institutions producing the bulk of the minority graduates. Nationally, while the average minority graduating class was 18, we found that 35 institutions graduated an average of 50 or more minority engineers per year from 1996 to 1998. Among those 35 institutions, 10 graduated an average of 100 or more minority engineers per year. North Carolina A&T State University had the greatest number of minority graduates, an average of 244 engineers annually during the years included in the study. The small number of institutions with a high average number of minority graduates reflects a similar distribution in the number of institutions with a high average number of minority freshmen (Figure 2).

We also looked at the minority share of the graduating class in order to better quantify the achievement of smaller institutions. Overall, the average minority representation in the graduating class was ten percent. Twenty-five institutions had a minority representation significantly above the national average with graduating classes at least 30 percent minority or greater. Of these, 15 were HBCUs and seven were HACUs. An additional ten institutions had a minority representation of at least twice the national average.

National Retention Rates

In estimating a national retention rate, comparisons of aggregate enrollment with aggregate graduation data for a given cohort provide an incomplete picture of performance because of such institutional differences as the time it takes to complete a bachelor's degree, the point at which students can declare their major, and the possibility that students transfer to other institutions. In order to account for these confounding factors, NACME defined parameters for inclusion and used an averaging algorithm to estimate both na-

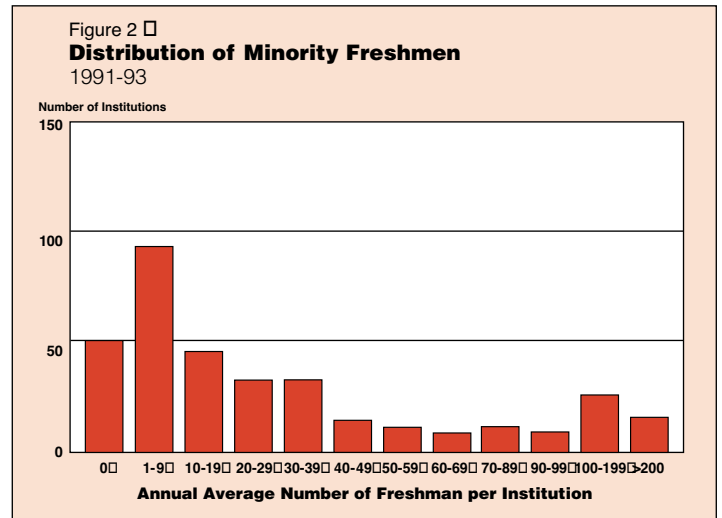

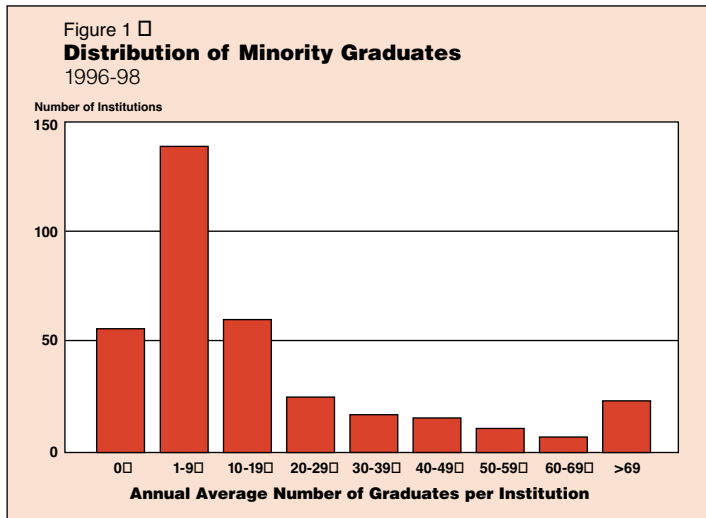

tional and institutional retention rates (see Computing the Retention Rate). Our final sample was comprised of 117 institutions for which we compared the entering freshman classes of 1991 to 1993 with the graduating classes of 1996 to 1998, and found that nationally, 36.5 percent of minority freshmen (African Americans, Latinos, and American Indians) are retained through graduation (see Tables 1 and 2). This is a slight improvement in the retention rate for minorities reported in our previous two studies. In contrast, there has been a significant improvement in nonminority retention since 1995, from 59.3 percent to 68.3 percent (Table 3).

Although the retention of minority freshmen increased, the more substantial change in nonminority retention has resulted in a widening of the gap between the rates at which minorities graduate relative to nonminorities. The relative retention index of 53.4 percent shows that a minority student entering engineering is only half as likely to obtain a bachelor's degree as a nonminority student. This is an increase in the disparity in retention rates since 1995 when the estimated relative retention index stood at 59.1 percent for a similar sample of institutions.

Disaggregating the data, we also examined graduation rates for African Americans, Latinos, and American Indians separately. We found the retention of African Americans and American Indians to be below the national average for all minority students; 32.3 percent of African Americans and 34.0 percent of American Indians who enrolled, graduated during the period covered by the study. In contrast, the retention rate for Latinos was 44.5 percent. In terms of the relative retention index, this means African Americans graduate at less than half (47.3 percent) the rate of nonminority freshmen; American Indians graduate at nearly half (49.8 percent) the rate of nonminorities; and Latinos graduate at almost two-thirds (65.0 percent) the rate of nonminorities.

Retention Rates at HBCUs and HACUs

A large proportion of African Americans and Latinos earn their bachelor's degrees

in engineering from Historically Black Colleges and Universities (HBCUs) and member institutions of the Hispanic Association of Colleges and Universities (HACUs), respectively. The HBCUs and HACUs represent 11.1 percent of the sample of institutions that met the criteria for inclusion, and they accounted for 32.4 percent of the minority graduating class. The average minority retention rate at HBCUs is 36.3 percent; and the retention rate for African Americans at those institutions is 36.1 percent. Though the overall minority retention rate at HBCUs is lower than the national minority retention rate of 36.5 percent, note that their retention rate for African Americans is higher than the national average for African Americans overall. Among HACUs the average minority retention rate is 35.0 percent which is lower than the national average for all institutions. Moreover, the Latino retention rate at the HACUs is only 36.0 percent compared to a 44.5 percent retention rate for Latinos overall (Table 4).

**Freshman Enrollment:
Precursor to Minority Graduations**

Recall that Table 1 shows the retention rates for each of the institutions included in the study, listed alphabetically, and Table 2 shows the same institutions ranked by minority retention rate and relative retention index. In examining these tables we found a number of institutions that performed better than the national average

in both minority retention rates and relative retention indices. However, their success was mitigated by the fact that the minority share of the freshman class and the graduating class was very small. The institutions with the best retention rates (60 percent or better) enroll, on average, fewer than 42 minority students annually, which was the national average minority freshmen class during the period covered by the study. Moreover, minorities constituted less than 16 percent of the freshman class at all of the institutions

with the best retention rates which was the average share of the freshman class nationally. Table 5 lists all engineering institutions ranked by the number of minority graduates and minority freshmen.

Regrettably, institutions that perform poorly in retaining minority students tend to enroll a higher percentage of minority freshman. Minorities constituted more than 25 percent of the freshman class at those institutions with below average minority retention rates (see Table 5). A low yield

Computing the Retention Rate

To compute a national retention rate we compare the average entering freshman cohorts from 1991-92, 1992-93, and 1993-94 to the graduating cohorts from 1995-96, 1996-97, and 1997-98. This averaging smooths variations in the amount of time students take to graduate. We also minimize other distortions in the data by accounting for institutional differences in the time at which students can declare a major and the possibility that students transfer to other institutions before graduating.

Institutions that acquire engineering majors after a first cohort may have an overstated freshman graduation rate. We, therefore, filtered out institutions with potentially skewed graduation rates by examining changes in enrollment between the freshman-to-sophomore and sophomore-to-junior classes. A 15 percent

increase in the total number of students (minority or nonminority) was the point at which we excluded institutions.

In order to assure that the institutions had a sufficient minority population to allow an assessment of relative performance, we eliminated all institutions with fewer than 10 minority freshmen for the years 1991 to 1993. Moreover, only institutions with complete enrollment and graduation data for all the years covered by the study are included. The appendix lists all institutions that are not included in the final sample, and the reason for their exclusion.

For the resulting sample of 117 institutions we compare freshman cohorts to the graduating cohorts. This comparison yields a minority graduation rate of 36.5 percent, and a 68.3 percent nonminority graduation rate.

from these institutions is a lost opportunity for increasing the number of minority engineers, where incremental improvements would create measurable growth in production.

Retention Rates and Selectivity

Selectivity is an index that denotes the rigor of the academic standards used as admission criteria by institutions. Institutions are grouped among five selectivity levels based on three parameters: the percentage of applicants who are accepted for admission, the high school class rank and the standardized test scores of the students who enroll at the institution.

Previous NACME research as well as the current study confirm that minority students perform extremely well at top engineering institutions. For both minority and nonminority freshmen, retention is positively associated with academic selectivity. Figure 3 shows that the retention rate of minorities at highly selective and very selective institutions is well above

the national average (36.5 percent). Specifically, 49.5 percent of the minority freshmen from the 1991 to 1993 class graduated between 1996 and 1998, compared to 81.3 percent of nonminority freshmen. Although the gap in graduation rates between minorities and nonminorities remains substantial, the highly selective institutions are demonstrating greater productivity than the non-selective institutions. At these schools — those that accept all freshmen applicants — the minority freshman retention rate is 17.6 percent compared to 46.6 percent for nonminority freshmen.

The positive association between retention rates and academic selectivity applies to private and public institutions. Figure 4 shows the retention rates for minority and nonminority freshmen at public and private institutions after controlling for academic selectivity. In general, minority students are retained at considerably higher rates at private than at public institutions by about ten percentage points at

very selective and selective institutions. In contrast, there exists little difference in the nonminority retention rates at private and public institutions, after controlling for academic selectivity. Although minority

and nonminority freshmen retention rates increase as the institution's academic selectivity increases, it is also important to note that the performance of individual institutions differs greatly within each academic selectivity group.

Impact of Financial Aid

The variation in retention rates across institutions has been attributed to individual student factors such as precollege academic preparation, or the level of commitment to completing a degree in engineering, and to institutional factors such as level of commitment to assuring that students complete their degree, as reflected in the allocation of financial aid and grants to students.

We examined the impact of financial aid resources to explain the observed variability in minority retention rates across institutions. The results presented in Table 6 indicate that meeting the financial need of minority students may be a key factor in addressing the problem of attrition observed in these communities. The correlation coefficients in the table indicate whether a statistically significant linear relationship exists between any two pairs of variables. The correlation between minority retention rate and the average scholarship and fellowship is positive and statistically significant. That is, the minority retention rate tends to be higher at those institutions with high average financial aid awards.

Table III
National Engineering Retention Rates and Relative Retention Index

	Retention Rate Minorities (%)	Retention Rate Nonminorities (%)	Relative Retention Index (%)
1980-81 - 1989-90	35.6	68.4	52.0
1986-87 - 1992-93	35.0	59.3	59.0
1991-92 - 1997-98	36.5	68.3	53.4

Source: NACME Research Letter, Vol. 2, No. 2, 1991; and NACME Research Letter Vol. 5, No.2, 1995

A study by the U.S. General Accounting Office indicates that, for students from low-income families, a shift of \$1,000 from loans to grants increases the probability of graduation by 14 percent. However, our analysis shows that all financial aid sources do not have similar impact on retention. The four main sources are federal grants, state grants, privately funded financial aid from foundations, individuals and corporations, and institutionally funded financial aid awards. The results in Table 6 show that minority retention rates tend to be lower at institutions with high average federal Pell grant awards.

Over the last 20 years, the purchasing power of the federal Pell grant has declined from about 75 percent to about 33 percent of total college costs at public four-year institutions. At private four-year institutions the purchasing power of the maximum federal Pell grant award has declined from 35 percent to 13 percent during the same period. Since the federal Pell grant is available primarily to low-income students, qualified students who receive it may have greater difficulty financing the costs of higher education at both public and private institutions.

Indeed, a recent study by The Education Resources Institute, Inc. (TERI) shows a wide disparity in net college costs by family income. The study estimated that family resources for students in the lowest income quartile (below \$40,000) could only cover 32 percent of net college expenses (after accounting for all grants) at a four-year public institution. On the other hand, for students in the highest income quartile attending college is very affordable. For these students, family resources can cover more than 70 percent of the net college costs at a four-year public institution. Hence, there exists enormous unmet need — at least 68 percent of net college costs — for students from low income families.

The declining purchasing power of the federal Pell grant may be one of several factors driving up the net costs of a college education for the poorest segment of the population. Minority students, who are disproportionately from families with income below the poverty line, may be

particularly affected by declines in grants at a time of rising college costs.

In addition, our results indicate that the decline in the purchasing power of Pell grants may be particularly consequential for students at public and selective institutions, (which select students at the 50th percentile and higher of their high school graduating class), who are more likely to qualify for and be awarded these types of grants. The correlation coefficients also reveal a positive and significant linear correlation between Pell grant awards and public institutions, and between selective institutions and Pell grant awards. These positive correlations indicate that Pell grant awards are significantly higher at public and selective

institutions, which have far fewer resources for financial aid to make up for the shortfall after federal grants are disbursed.

The correlation between public institutions and average financial aid from all sources is negative and significant. There is also a negative and significant correlation between selective institutions and average financial aid awards from all sources. These negative correlations indicate that public and selective institutions provide smaller financial aid awards. As a result, qualified students who receive federal Pell grant awards may be less likely to find the additional financial resources needed to cover their college costs through graduation.

NA = Not Available

Note: Engineering institutions included in the Engineering Workforce Commission (EWC) database but excludes the University of Puerto Rico and the Polytechnic University of Puerto Rico. Averages were calculated from available data and rounded to the nearest integer.
Not all institutional averages include three years.

Table VI
Correlates Between Retention Rates, Financial Aid Awards and Other Relevant Variables

	Minority Retention Rate	Nonminority Retention Rate	Relative Retention Index
Average Financial Aid Funding	.412+	.069	.408+
Average Federal Pell Grant	-.222*	-.273*	-.109
Average State Grant	.153	.129	.100
Average Private Financial Aid Funding	.254*	.044	.249*
Average Institutional Financial Aid Funding	.272*	-.031	.308+
Public Institutions	-.329+	.043	-.417+
Private Institutions	.329+	-.043	.417+
Highly Selective Institutions	.215	.119	.172
Very Selective Institutions	.280*	.237*	.163
Selective Institutions	-.218*	-.149	-.123
Less Selective Institutions	-.296+	-.266*	-.228*

Note: + Correlation is significant at the .01 level (2-tailed test);
 * Correlation is significant at the .05 level (2-tailed test).
 In this matrix the sample size is the same for each pair of coefficients. That is, only institutions with complete data for all variables considered are included in this matrix. The sample size is 79 institutions. Significant correlations are shown in bold type.

On the other hand, the correlation between minority retention rate and privately and institutionally funded financial aid is positive and statistically significant. This finding indicates that the retention of minorities in engineering may be responsive to changes in the types of financial aid awarded at their institutions. If so, it reveals a key policy variable that can be used to improve the minority retention rate and to reduce the attrition of minorities in engineering across all institutions.

Table 6 also shows that nonminority retention rates tend to be significantly lower at institutions with high average Pell grant awards. However, unlike the data for minority students, there is no significant relationship between average privately and institutionally funded financial aid awards and the retention rate of nonminority freshmen. This lack of a significant correlation may indicate that the average nonminority student has greater access to other resources such as family economic support, or be more inclined to apply for loans or work while attending school such that their educational costs are financed through a variety of sources. Hence, as private and institutional sources of financial aid shift, these students are able to continue financing their education without interruption. However, a substitution from grant to loan and employment may likely affect the amount of time students take

to graduate as well as choice of major. Multivariate analyses also show that financial aid is a significant predictor in retaining minority students. Using the sample of institutions, we find that financial aid and institutional control explain ten percent of the observed variance in minority retention rates for the sample of institutions. The estimated coefficient for financial aid is statistically significant at the five percent level. The coefficient on institutional control is not statistically significant. After accounting for institutional selectivity, the explained variance in minority retention rate increases to 15 percent. In addition, the regression coefficient for academic selectivity indicates that the minority retention rate is lower at less selective institutions, holding factors such as financial aid and institutional control constant. This suggests that although financial aid is important, minority students have a greater probability of graduating from academically challenging institutions, and highly competitive educational settings. As is the case for the bivariate analysis, financial aid is not a significant predictor of nonminority retention rate.

Recommendations

In the often recounted story of the first day in an engineering institution, the dean mounts the podium and ominously introduces the freshman class to the rigors of an engineering education. "Look to your left," he intones prophetically, "look to your right. One of the three of you will not make it to graduation." If he were addressing only a nonminority audience, sadly, the dean would be correct. For minority stu-

dents in the same auditorium, however, the unconscionable truth is that two of the three will not make it to graduation.

While minority access to an engineering education has increased substantially over the last 25 years, the production of minority engineers by the nation's colleges and universities remains far below its potential. NACME studies continue to show that retention rates of minority freshmen who enroll in engineering have been intractable since the early 1980s. Based on samples of over 100 institutions, our research indicates that two-thirds of all minority students who enroll in engineering will not earn their engineering degrees, while two-thirds of their nonminority classmates will. This is a widening of the disparity in retention rates since we last analyzed the data in 1995.

Given that the African American, Latino and American Indian men and women who enter engineering are among the best educated minority high school graduates in the country – young people who can choose to major in any discipline at one of our premier institutions – this is an enormous waste of potential at a time when the nation needs it most. On the doorstep of the 21st century, America's burgeoning scientific enterprise has never been more hungry for talent. Engineering employment has surpassed the two million mark, unemployment is below two percent, and year after year, our technology based industries vigorously lobby Congress for an increase in visas to import scientists and engineers. Still, we have not made the investment necessary to produce our own technical workforce from our own underrepresented communities.

African Americans, Latinos, and American Indians comprised only ten percent of the engineering graduating class this year, although they now constitute 30 percent of the college-age population. Confounding the potential for growing participation in the future, minority freshman enrollment has dropped precipitously during the 1990s. Undoubtedly, declining enrollments combined with persistently low retention rates can be expected to lead to decreases in the number of minor-

ity engineering graduates for at least the first four years of the new millennium.

This study indicates that investment now is key to increasing the number of minority engineers. Graduation from an institution of higher education results from a multi-dimensional process involving the interaction of the individual, the institution, and the education policies supported by society. In this interaction, the availability of financial aid is one of the key institutional factors affecting students' choice of major and probability of graduation, as indicated both by NACME's engineering-specific data and by the data of other researchers (see, for example, John and Noell, 1989; Orfield, 1992). It is indeed fortunate that investment has proved to be such a powerful lever in improving minority attrition. Unlike other institutional factors such as low peer and faculty expectations, unsupportive campus climate, absence of role models, the challenging culture of mathematics and science, and lack of diversity, inadequate financial aid is relatively easy to fix.

At the federal level, policy makers must act aggressively to restore the affordability of a college education. Drastic shifts over the last two decades from grants to loans and the decline in the real purchasing power of the federal Pell grant – while tuition and fees skyrocketed – are inconsistent with the goal of addressing underrepresentation of minority students in higher education (Orfield, 1992). These trends, compounded by changes in financial aid policies at universities that have reduced need-based funding from other sources, have erected barriers to achieving a college education and social mobility for the poor who are disproportionately minority. Particularly in rigorous science-based disciplines such as engineering, where the time demands of course work make employment while in school impractical, inadequate funding seriously handicaps the retention prospects of those who enroll. It is therefore essential to restore the purchasing power of the Pell grant to stimulate the poorest segments of the population to choose and persist in an engineering major.

The federal agencies that support the nation's academic research enterprise also have a critical role to play in assuring diversity in the technical workforce. Each year, institutions classified as Research I and Research II receive between \$16 million and \$40 million in federal support. This high level of commitment to finance excellence in research and education is made possible by all U.S. taxpayers – minority and nonminority – making it incumbent upon receiving institutions to devise systems and policies that are effective in assuring equal education outcomes for all students regardless of race, ethnicity, gender or class. In awarding grants and contracts, it is crucial that the government hold institutions accountable for establishing and meeting human resources goals that serve the full range of American people. This means leveraging awards by linking review criteria to measurable achievements in diversifying both freshman and graduating classes.

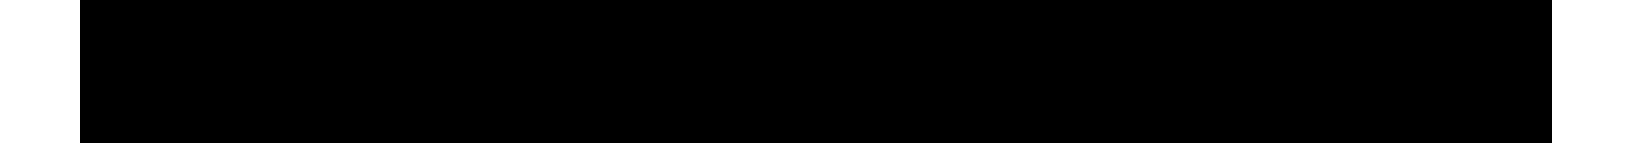

The states too, which are actively competing for new revenue-generating industry in the high-tech sector, bear significant responsibility for developing the highly skilled workers these companies demand. In fact, the overwhelming choice of public institutions by low income minority students magnifies the impact of tuition and financial aid allocations made by state legislatures. To the detriment of retention in engineering at the majority of large state institutions, higher education is in direct competition for funding with both health care and corrections industries, and the latter two are winning. State legislators – enlightened by university and corporate leaders – must begin to weigh the potential returns of investment in education, and specifically engineering education, as an important route to increased corporate tax receipts, accelerated economic development in the minority communities and ultimately, a higher standard of living for every resident of the state.

Finally, our universities need to invest. Since NACME's first studies of retention, we've noted that the institutions posting the greatest achievement in graduating

minority engineers often enroll the smallest number of minority freshmen. Conversely, many of the institutions that enroll minorities as a large fraction of their entering freshman engineering class have been dismally unsuccessful in ensuring that these students graduate. This long lived inverse relationship between institutional minority enrollment and retention must not be perpetuated.

America's most highly selective colleges and universities – those that lead the nation in research grants from both corporations and government – are also those that have demonstrated unequivocally that minority scholars in highly competitive environments, despite anti-affirmative action rhetoric, perform extraordinarily well. Responsible for turning out tomorrow's leadership cadre of engineers, these institutions must also be responsible for producing engineers who can communicate effectively across racial, ethnic and gender barriers, and whose creativity is enhanced by access to the world view of others. Such social growth does not happen in homogeneous environments. These institutions must be held accountable at the policy level, by their funders and by their trustees, for investing in a freshman class that much better reflects the composition of the nation's people.

At those universities where a diverse population does exist, at the large public institutions to whom we entrust the lion's share of our best educated minority students, performance must be brought in line with the promise of a college education. NACME believes that an incoming class of minority and nonminority freshmen, admitted to the same institution under the same set of entrance criteria, should anticipate graduating in equal proportions. While the identification of inadequate financial aid as a significant predictor of retention might tempt university administrators to push responsibility to state and federal funders, significant accountability rests with the allocation of existing resources. When year after year, huge numbers of minority freshmen do not return for the second year, institutions need to

look at how they are budgeting to fill (or not fill) the seats in the sophomore class, how they are spending their existing financial aid dollars, and how active they are in securing scholarship funding for minority engineering students from all potential sources.

It's time to invest in our nation's future. This year, our country's fastest growing industries will hire more scientists and engineers from abroad than our engineering schools will graduate. Consistently, CEOs of our top producing companies have said that developing the human resources to maintain our competitive edge and sustain our economic growth is one of the toughest problems we'll face in the coming years. And all across the policy-making community – in government, the corporate sector and academia – the complex issues of technical workforce development encompass education challenges from kindergarten through graduate school and into the workforce itself. But the most rapid route to expanding the number of minority graduates from our engineering institutions is at hand. By making available high quality scholarships we can significantly increased the retention of the talented young men and women already enrolled – an investment in keeping what we've got.

Endnotes

1. This represents a decline of 72 minority graduates from the 6,446 graduates originally reported by NACME. The number was adjusted after we found that the 1997-98 graduation data released by the Engineering Workforce Commission had overstated the number of minority graduates for Kettering University.
2. Campbell, G., Jr., Denes, R., Friedman, D. L., Miyazaki, L. "Minority Graduation Rates: Comparative Performance of American Engineering Schools." NACME Research Letter, Vol. 2, No. 2, NACME, New York, NY, 1991; and Morrison, C., Griffin, K., Marcotullio, P. "Retention of Minority Students in Engineering: Institutional Variability and Success." NACME Research Letter, Vol. 5, No. 2, NACME, New York, NY, 1995.
3. Enrollment and graduation data are obtained from the Engineering Workforce Commission which collects annual data on enrollment and graduation of minorities and women from all accredited engineering institutions in the United States under a grant from NACME.
4. See Campbell et al.; and Morrison et al. as cited in footnote 2.
5. Data on each institution's academic selectivity were obtained from Peterson's Guide to Four-Year Colleges: 1998, 28th Edition. Peterson's, Princeton, NJ, 1997. An institution's academic selectivity classification falls in one of five categories:
 - Highly selective institutions select students from the top 10 percent of their high school graduating class.
 - Very selective institutions select students from the top 25 percent of their high school graduating class,
 - Selective institutions select students from the top 50 percent of their high school graduating class,
 - Less selective institutions select some students from the lower 50 percent of their high school graduating class;
 - and Non selective institutions have an open admission policy.
6. In the sample of 117 institutions that met the criteria for inclusion in the study, there were no private less selective or private non selective institutions. Only the University of Virginia, a highly selective public institution met the criteria for inclusion in the sample which is not included in Figure 4.
7. The data on financial aid awards were obtained from the Integrated Postsecondary Education Data System, 1995 (IPEDS). The data are collected yearly from all U.S. colleges and universities by the National Center for Education Statistics. At the time of this analysis, the 1991 through 1995 IPEDS data were available. Note that the 1991 to 1995 academic year for which data were extracted covered the time period that the engineering freshmen cohorts included in this analysis were enrolled. An average institutional financial aid award per student per year was calculated. Then an average value for 1991 to 1995 was calculated and adjusted by the consumer price index (CPI-U, 1982-84 = 100). The consumer price index data were obtained from the U.S. Bureau of Labor Statistics web site on February 19, 1999 (www.bls.gov).

11. Ibid.
12. Using individual-level data from the 1980 and 1982 High School and Beyond database, St. John and Noell (1989) find that financial aid had a significant positive impact on enrollment decisions of blacks, Latinos, and whites. However, after controlling for family background they find that financial aid had a stronger impact on access for minority students than for whites. For more detailed information on the study the reader is referred to: St. John, E. P., Noell, J. "The Effects of Student Financial Aid on Access to Higher Education: An Analysis of Progress with Special Consideration of Minority Enrollment." Research in Higher Education, Vol. 30, No. 6, 1989.
13. Note that the correlation coefficients do not reveal any information about time to graduation.
14. Campbell, G., Jr., Human Resources and Career Opportunities in Science and Technology: Will There be Enough Jobs? Implications for Equity, NACME, New York, NY, 1995.
15. Orfield examines the relationship between money, access to college for minority and poor students. In the analysis Orfield finds that finances limit the choices of minority students. Particularly, African American students are more dependent on financial aid in order to persist in college than their white counterparts. For more details on this study the reader is referred to: Orfield, G. "Money, Equity, and College Access." Harvard Educational Review, Vol. 62, No. 3, Fall 1992.

Excluded Institutions

Institutions Where Freshmen Do Not Declare Major

Cal Inst of Technology
Harvard University
Mass Inst of Technology

Institutions Where Freshmen Enrollment Data Was Not Reported in at Least One Year

Air Force Inst of Tech
Capitol College
Cedarville College
Cogswell College
College of St Thomas
Colorado Technical Univ
Fairfield University
Geneva College
Humboldt State University
Northrop University
Pratt Institute
Southeastern Mass Univ
Trenton State College
NorthTrinity College
U NC-Chapel Hill
U of Southern Maine
U Redlands
U San Diego
U Texas-Pan American
U Texas-Permian Basin
U West Va-Grad Studies
U Wisconsin-Parkside
Univ of North Florida
US International Univ
US Military Academy
US Naval Academy
US Naval Postgraduate Sch
Washington U (STIM)
Wentworth Inst of Tech
Winona State University
U Florida
SUNY-Binghamton Campus

Note: Three additional institutions were excluded but are not listed in the appendix. The University of Wisconsin-Milwaukee, and Washington State University are excluded because they had an increase in nonminority freshman-to-sophomore exceeding 15 percent. Hampton University did not enroll nonminority freshmen during the period of the study, although 1 nonminority student graduated in 1996-97, and 2 graduated in 1997-98. The minority retention rate at Hampton University is 9 percent.

Excluded Institutions

Institutions With Minority Freshman Class of Less Than Ten Students in at Least One Year
